COVID-19 Patient Instructions After Testing

WHAT SHOULD I DO WHILE I WAIT FOR MY RESULT?

- Self-isolate to your home. If you live with others, self-isolate in a private room and use a private bathroom, if possible. Interact with others as little as possible.
- Wear a mask when you enter general living areas.
- Whoever else lives in your home should also stay at home.
- Make a list of close contacts from two days before you became sick until you self-isolated. Close contacts are those who have been within 6 feet of you for 10 minutes or more.
- If you develop additional symptoms or if your symptoms get worse, notify your healthcare provider immediately for further instructions.

WHAT SHOULD I DO IF I TEST POSITIVE?

- Notify your close contacts and let them know they should self-isolate at home for 14 days since their last contact with you. This includes your family members and anyone who lives with you.
- Self-isolate in your home until each of the following conditions are met:
  1. It has been at least ten days since your symptoms first appeared AND
  2. It has been at least three days since you have not had a fever (without using fever-reducing medications) and your respiratory symptoms are improving (e.g., cough, shortness of breath).
- Practice social distancing for seven days since you last had symptoms.
  1. While you do not have to remain in isolation, you may not return to work until seven days after your symptoms have resolved.
- Continue to self-monitor for symptoms for fourteen days since you last had symptoms.
- If your symptoms get worse or if you require hospitalization, notify your healthcare provider immediately and follow instructions about wearing a mask when you arrive to the facility.

WHAT DO I DO IF MY TEST IS NEGATIVE?

- If your test is negative and you had a known exposure to a confirmed case, quarantine until 14 days after your exposure.
- If your test is negative and you had no known exposure to a confirmed case and you are asymptomatic (do not have symptoms), you can stop self-quarantine. Continue to practice social distancing.
- If your test is negative and you had no known exposure to a confirmed case, but you are symptomatic, you may have another respiratory pathogen that is circulating in the community. Avoid work and group settings until three days after you have not had a fever (without using fever-reducing medications) and your respiratory symptoms are improving.
